

Pitch Script

Last week, I was climbing with two friends.

I'm taller than Jenna,
but that didn't make me a better climber.

And Anthony is stronger than me,
but that didn't make him a better climber either.

In climbing, the same route can have many different solutions.
We call these solutions beta—the sequence of moves used to complete a route.

But most betas shared online don't consider differences in body types.

AltRoute generates personalized AI beta tailored to your body and reach,
so every climber can find their own solution.

Climbing is a fascinating sport because the same route can have many different solutions.

Even if I'm taller than someone else, that doesn't make me a better climber.

And even if another climber is stronger than me, that doesn't make them better either.

In climbing, these different solutions are called **beta** — the sequence of moves used to complete a route.

But most beta shared online assumes everyone climbs the same way and rarely considers differences in body type.

AltRoute generates personalized AI beta tailored to your body and reach, helping climbers discover solutions that actually work for them.

Because in climbing, the best beta isn't universal — it's personal.

Poster Script

This is **AltRoute**, a climbing assistant designed to help climbers find beta that works for their own body type.

During our needfinding interviews, we discovered that many climbers struggle because the beta they see online often doesn't match their body types. For example, moves that work for taller climbers can be difficult or even impossible for shorter climbers.

The closest existing product is KAYA, which allows climbers to watch beta videos shared by others. However, users may struggle to find videos that match their body type, making it less effective.

AltRoute addresses this by generating **personalized AI beta** based on each climber's body profile and skill level.

What makes our solution different is that the beta is delivered as **interactive, step-by-step guidance**. Climbers can move forward or backward through the sequence while climbing, allowing them to follow the beta at their own pace. By revealing the beta in steps, we preserve the problem-solving aspect that climbers enjoy.

The guidance can also be delivered in two different ways. Users can either **follow the steps on their phone screen**, or receive **voice instructions through headphones**, so they don't have to constantly look at their phone while climbing.

And now we'll move to a short demo video to show how AltRoute works.

Demo Video Script

AltRoute is a climbing app that helps climbers find community-shared betas, and also use AI to generate one based on their physique and skill level.

Let's say I'm climbing at the Santa Barbara gym and attempting Route 1, and I want to watch a beta.

First, I search for my gym. Some nearby gyms are already listed, so I'll tap into the Santa Barbara gym. Here, I can see all the betas that climbers have posted for routes in this gym.

I'm looking specifically for Route 1, so I'll filter the betas, select the route, and show the results.

Unfortunately, there aren't any betas available for this route yet — which is a pretty common real-world problem.

Back on the home screen, there's a widget introducing our AI beta generation feature. Since this is new to me, I can tap "Learn More" to understand how it works.

Once I'm ready, I tap "Generate Now" and upload the route. Since I'm currently attempting the red route, I'll select the holds that belong to it, then confirm the selection.

Next, I enter my body profile and select the climbing skills I'm confident in, then tap Generate.

Now the AI creates a personalized beta for me. These instructions explain that I can move through the beta using the playback buttons or by jumping to specific steps. I'll also save it so I can access it later from my profile. And just as a reminder, the app encourages users not to use their phone while actively climbing.

I can choose to either listen to the instructions or view them on my phone. I'll choose to view them today.

The app now guides me step-by-step throughout the beta, highlighting the holds and explaining each move.

Let's say I've watched the beta up to step three and want to try the climb. I'll return and select "Save and Exit".

This icon shows that it's my newly generated beta.

After trying the climb, I can come back, tap the beta again, and continue watching from where I left off.
