

AltRoute README

Hyun Cho | Shuang Li | Xin Ping Xandra Wong

Target Audience

The value proposition of **AltRoute** is to support gym climbers who struggle with one-size-fits-all beta.

With our target audience being beginner to intermediate climbers, AltRoute helps our users generate **personalized AI-based beta solutions** based on their height, reach, skill level, and current physical constraints.

Our goal is to help climbers feel:

- Included (solutions adapted to their body)
- In control (AI suggests, user decides)

- Supported (step-by-step guidance available when needed)

Access & Setup

You can access the AltRoute Medium-Fi prototype design page through link:

<https://www.figma.com/design/mm2RdzlnWcByrynOd0TpXq/AltRoute?node-id=0-1&p=f&t=x4QZR7tRc14cjSo6-0>

You can use this link where the prototype is ready for interaction.

<https://www.figma.com/proto/mm2RdzlnWcByrynOd0TpXq/AltRoute?node-id=116-639&p=f&t=x4QZR7tRc14cjSo6-0&scaling=scale-down&content-scaling=fixed&page-id=0%3A1&starting-point-node-id=116%3A639&show-proto-sidebar=1>

No installation is required.

Intended Device

AltRoute is intended to run on mobile smartphone devices, and this particular prototype was designed using the specifications of the iPhone 17.

For this medium-fi prototype, however, it is recommended that the user access the prototype via a desktop computer or laptop.

Context

AltRoute is intended to be used inside a climbing gym during real climbing sessions.

Users can accomplish the following:

- **Discover**

Users can search for a gym and browse community-shared betas. They can filter betas based on height, reach, skill level, and route.

- **Generate**

Users can upload or take a photo of a climbing route. They can then select holds and input their body profile to generate a personalized beta using AI.

- **Climb With AI Guidance**

Users can follow a step-by-step beta guide. Voice guidance is optional.

Users can pause, resume, and navigate between steps.

Prototype Operation

General

Only elements highlighted in blue are interactive in the Figma prototype.

Any element that is not clickable has not been implemented in this medium-fi version.

There are 3 task flows that a user should be able to complete in our app, listed on the sidebar on the left.

Simple Task

(Find a route-specific beta for a specific gym)

1. Starting from the Home page, click the search bar.
2. Type or select a gym from the nearby list.
3. Select a beta from the list.
4. View the beta video.
5. (Optional) Apply filters to narrow results to specific routes or betas by people matching your body type.

The user can now watch and reference a beta for a specific route.

Moderate Task

(Generate a personalized AI beta)

1. From the Home page, click the "+" (Generate) button or "Generate Now" button.
2. Select "Take Photo" or "Upload Image" to upload an image of your route.
3. Tap to select the holds for this route (orange color holds for this prototype). Tap again to deselect.
4. Confirm hold selection.
5. Enter body profile details (height, reach, skill level, current injuries).
6. Click "Generate AI Beta."

The system generates a personalized, step-by-step beta sequence for the user.

Complex Task

(Receive real-time guidance during climbing)

1. Open the generated beta and tap on the arrows to read through the guides.
2. Optionally activate Voice Guidance.
3. Click "Start Climbing."
4. Navigate through steps using Next / Previous controls.
5. Pause and resume as needed until the end. This beta has only 5 steps, as indicated by the progress bar. Jump to specific steps using the numberings at the bottom.
6. To exit, tap the "return" button, and select "Save and Exit". You can also make changes to the route or body profile information by selecting the "return" button. However, note that your current beta may not be saved.
7. Completing the beta brings you to the Profile page, where the newest generated beta is under the Generated tab of the "Your Betas" section.

The system provides step-by-step instructions with visible progress indicators.

Prototyping Tools

This prototype was built using **Figma** for interface design and interactive linking.

All screens, buttons, icons, and UI elements were created within Figma.

Route images were used for simulation purposes.

Limitations

Due to Figma limitations:

- AI beta generation is simulated and does not dynamically change based on input.
- Voice guidance is not a functional audio playback.
- Community beta browsing uses sample data.
- No real-time movement tracking is implemented.
- Resume and progress tracking are visual only.

Testing was conducted in a simulated environment rather than a live climbing wall.

Wizard of Oz Techniques

The following Wizard-of-Oz methods were used:

- AI-generated beta sequences are pre-written and fixed.
- Body profile inputs do not affect output.
- Voice guidance is simulated visually.
- Generated results are predetermined.

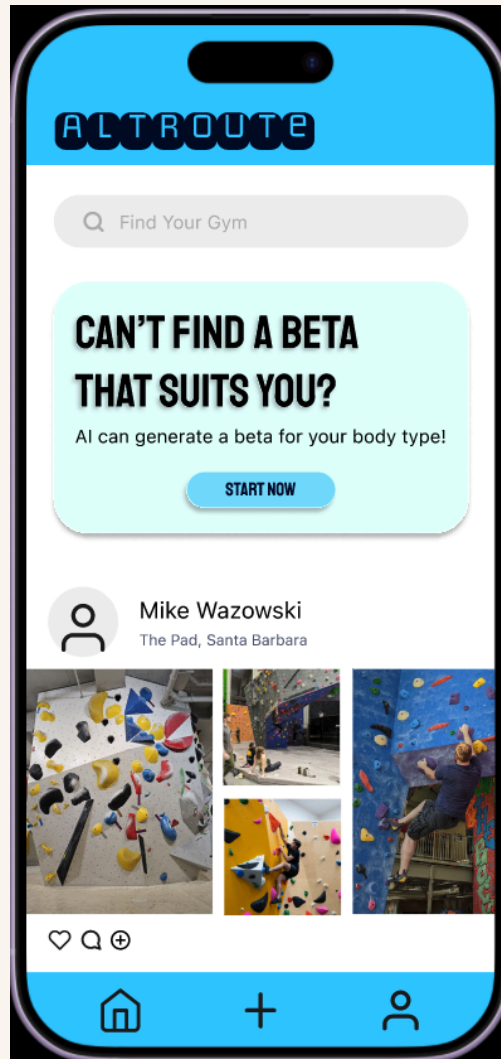

These techniques were used to evaluate interaction flow and usability without building full backend AI functionality.

Hard-Coded Items

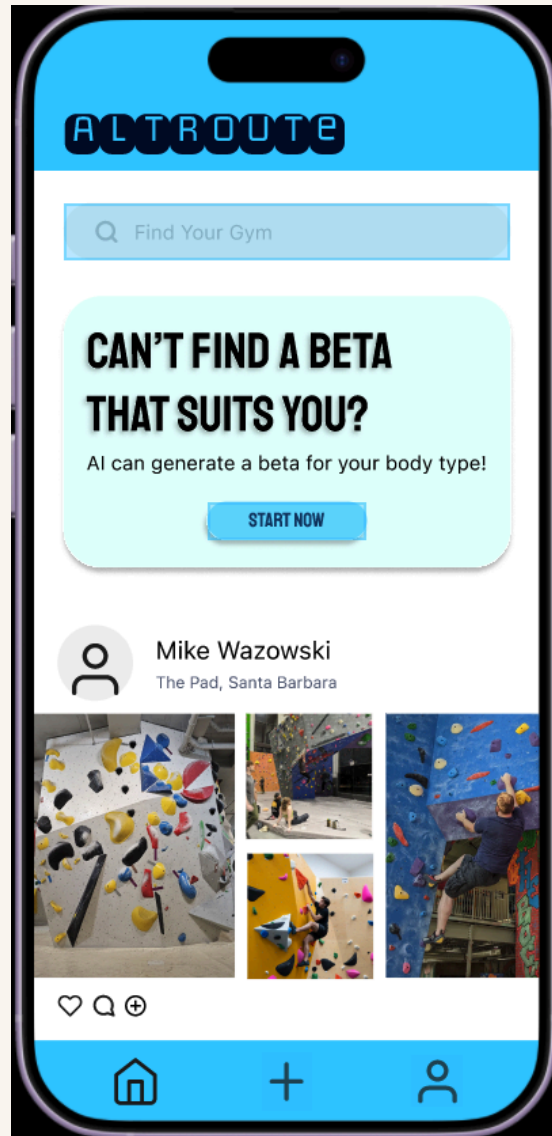

To simulate functionality within Figma:

- Gym list and route data are preloaded sample data.
- User's profile data is sample data
- Generated beta steps are fixed.
- Save/comment actions are visual only.
- Voice option toggles do not activate real audio.

Images

Home Page

Blue highlights show what can be clicked. Anything not highlighted, cannot be clicked.
